FOR THE PERSON SETTING IT UP

Drydock setup checklist

A one-time, twenty-to-thirty-minute sit-down that leaves a non-technical person able to build with Claude Code and Drydock without ever opening a terminal again. Do it in person or by screen share with control (on a Mac: Messages or FaceTime screen sharing, then "Ask to control"; on Windows: Quick Assist). You press the buttons. They type their own passwords.

Before you start

- □ They have a **paid Claude plan** (Pro or above) and can sign in at claude.ai. Without this, Claude Code does not exist for them.
- □ You know whether the computer is a **Mac or Windows**, and they know its **password** (installing programs asks for it).
- □ They have, or will create during the sit-down, a free **GitHub** account and a free **Netlify** account. They choose the passwords.
- □ 30 minutes, a stable internet connection, and the playbook PDF open somewhere.

The sit-down

1. The Claude desktop app (5 minutes)

1. Download from `claude.com/download`, install, open it, and let them sign in.
2. Click the **Code** tab once so it finishes its own setup.

2. Run the installer (10 minutes, mostly waiting)

Mac. Open Terminal (press Command and Space, type Terminal, press Enter). Paste this one line and press Enter:

```
bash <(curl -fsSL
https://raw.githubusercontent.com/wjp3/drydock/v0.1.0/install/Install-
Drydock.command)
```

Windows. Open PowerShell as administrator (press the Windows key, type PowerShell, right-click it, Run as administrator). Paste this one line and press Enter:

```
irm https://raw.githubusercontent.com/wjp3/drydock/v0.1.0/install/Install-Drydock.ps1
| iex
```

The installer adds, in order, only what is missing: git, Node.js, GitHub's command-line tool, Claude Code's command-line tool, the Drydock plugin, and a `Builds` folder with a START HERE note. It opens the browser for sign-ins. When the computer asks for its password, they type it. When GitHub opens in the browser, they sign in (or create the account) and click **Authorize**.

> **If you were emailed the installer file instead:** on a Mac, right-click `Install-Drydock.command` and choose Open (double-clicking a downloaded script is blocked the first time). On Windows, right-click `Install-Drydock.bat` and choose Run as administrator; if "Windows protected your PC" appears, click More info, then Run anyway.

3. Netlify (3 minutes)

1. Create the free account at `netlify.com` (they choose the password).
2. Drydock signs the computer in to Netlify the first time it ships, through the browser. Nothing to do now.

4. Prove it works (2 minutes)

1. In the Claude app, Code tab, open the folder `Builds / my-first-build`.
2. Type `/` in the message box. You should see `/drydock:help` in the list. Run it.
3. If it is not there: type `/plugin marketplace add wjp3/drydock`, then `/plugin install drydock@drydock`, then try again.

Their first build, together (45 to 90 minutes)

Do this part with them at the keyboard and you beside them. The goal is that they see the whole loop once: a plan, a stop with evidence, saying "next", and a handoff.

1. `/drydock:setup`. They answer the four questions. Choose the plan honestly; the light tier is right for Pro.
2. `/drydock:plan`. They describe what they want in their own words. Let them answer the interview; resist answering for them. Read the vision back together. The map review will propose changes; they decide.
3. `/drydock:build S0`. The skeleton: an empty app at a web address, one passing test, code on GitHub. Watch the stop message arrive. Point at the evidence lines.
4. `/drydock:ship`. Preview first, verified by loading it. They say "go live" or not. Show them the preview link on their phone.
5. Say **next** and build S1 if time allows. Otherwise `/drydock:handoff`, close the app, reopen it, and `/drydock:wake` so they see that nothing was lost.

Leave behind

□ The playbook PDF, with pages 2 and 3 (the quickstart) printed.

□ The START HERE note the installer put in their Builds folder.

□ The three sentences: "Show me the evidence." "Stop and tell me what's blocking." "Handoff."

□ Your phone number, and the agreement that a screenshot of the screen is a fine way to ask for help.

If something goes wrong

Symptom	Fix
Terminal says "command not found: claude" right after installing	Close Terminal and open a new window, then run the installer line again. New programs appear in new windows.
The Mac blocks the installer file	Right-click it, choose Open. Or use the one-line Terminal command instead, which is never blocked.
Windows shows "Windows protected your PC"	More info, then Run anyway. Or use the one-line PowerShell command.
No `/drydock:help` in the slash menu	Type `/plugin marketplace add wjp3/drydock` then `/plugin install drydock@drydock` in the message box. If the app was open during the install, quit and reopen it.
The GitHub sign-in page never opened	In Terminal or PowerShell: `gh auth login --web`, then paste the code it shows into the browser page it opens.

"Usage limit reached"	The plan's allowance for the period is spent. Wait for the reset. Keep the light tier.
It asks for a password in the chat	Never type one there. Sign-ins happen in the browser only. Say "no" and close the prompt.
A permission box about pushing or deploying appears and they did not ask for it	That is the owner gate working. Deny it. Nothing happens.
